

"Global warming is over and the world has been colder every year than its peak a decade ago" - pointed out Piers Corbyn astrophysicist of WeatherAction today 18th Jan "Yet the Met Office and World Meteorological Organisation are in denial of reality and their latest pronouncements are blatant misinformation in what amounts to a 'Cover-Up' in a desperate bid to shore up the failing ideology and pseudo-science of supposed man-made Global Warming and Climate Change.

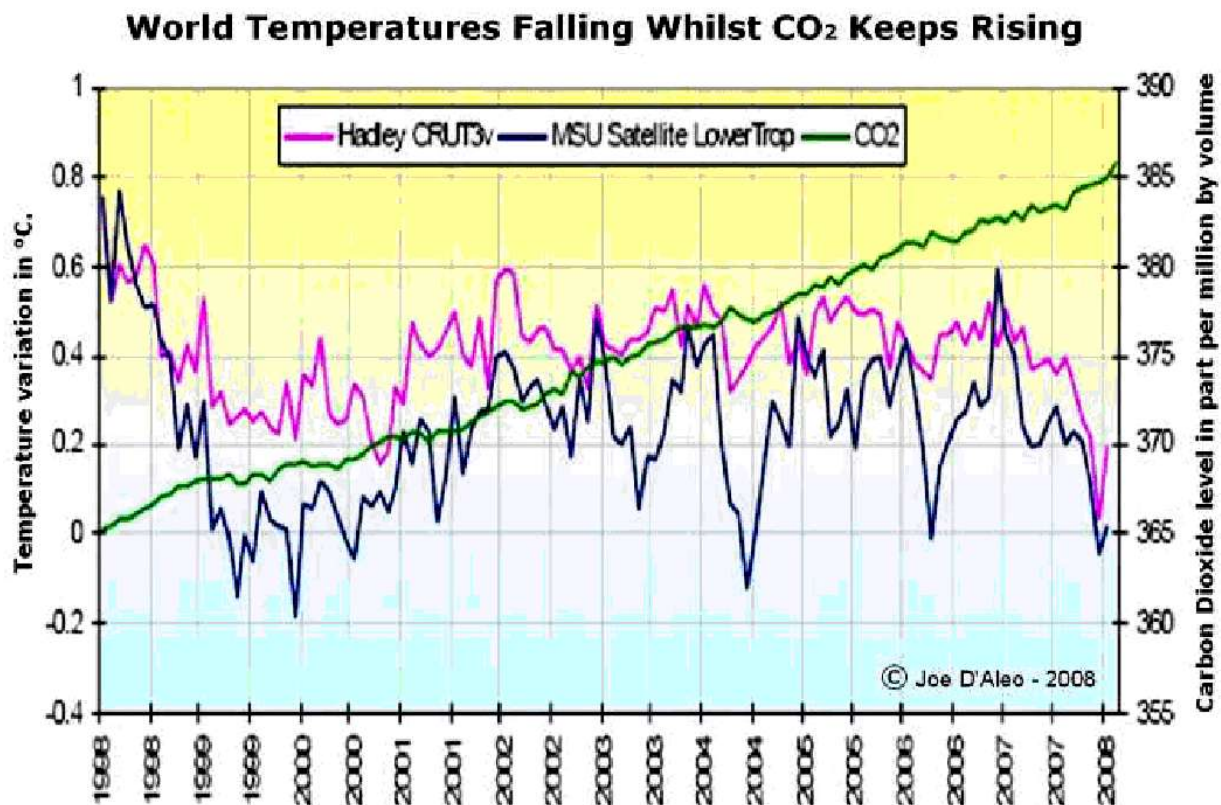

"Astoundingly," said Piers "The MO & WMO show a grasp of statistics which is bettered by the average seven year old. In reporting on 2008 they fail to admit the world cooling which denies all the predictions of their models over the last 10 years.

"They glibly state - vainly hoping to prove man made global warming - that the World Meteorological Organization (WMO) preliminary report puts mean temperature for 2008 at 14.3°C, making it *'the tenth warmest year on a record that dates back to 1850'*. (<http://www.metoffice.gov.uk/corporate/pressoffice/2008/pr20081216.html>)

"What they don't say is that 2008 is the COLDEST of those ten years, that 2008 is the coldest since 2000, that 9 of the last 12 years have been warmer than 2008, that the trend of world temperatures is down (see graph below), and that they have no data evidence which shows that CO2 levels drive or ever have driven world temperatures or consequent climate change".

{For official data see: <http://www.cru.uea.ac.uk/cru/data/temperature/hadcrut3vgl.txt> The right hand column is the world average relative to the 1961-1990 mean of 14.0C. The 2008 figure of 0.326 so far being estimated forward to be going to turn out as 0.31, it appears, although the difference does not affect the 'league table').

The graph of official data which the Met Office and WMO did not show:

"Since the natural cycles (see previous press release below) of world temperature peaked ten years ago it follows that most of the last 12 years will be warmer than some time further in the past. Yet the MO & WMO bizarrely try to elevate this elementary fact of statistics into some sort of 'evidence' for their case. **That is why they don't show the graph of official data which indicates that world temperatures are falling while CO2 is rapidly rising.** If you walk 10 miles from the top of a hill with a child and find you are lower down than at any time in the last 8 miles you would be hard pressed to convince the child that you were still going up!

"The Met Office, WMO and UN Climate Committee (the IPCC) have failed to produce data evidence to support their theory and justify their policies despite reasonable requests from an international group of scientists:

(Eg - for one such request - http://www.lowefo.com/pdf/Letter_UN_Sec_Gen_Ban_Ki-moon.pdf).

If they had evidence wouldn't they produce it? If world temperatures were still rising as their theory said they should then wouldn't they crow over that? Now instead if pressed they say '10 years is too short to judge' or talk mysteriously about 'natural processes dominating temporarily' [yes - read that again - temporarily (!) dominating despite the rapidly rising CO2 which they had claimed was 'unprecedented' !!]. Note they didn't say a week was too short to judge when there were heatwaves years ago. If they would care to judge longer periods - 400, 4,000 or 40,000 years long their case still fails on every time scale. The world was warmer in the Bronze age 4,000 years ago when there was much less CO2.
